## Exponents II

1. Refer back to your Day 4 activity. Record the population of each continent in scientific notation rounding to two decimal places. Then convert the area of the continent to scientific notation.

| Continent | Population in <br> Scientific Notation | Area in Standard <br> Notation $\left(\mathrm{km}^{2}\right)$ | Area in Scientific <br> Notation $\left(\mathrm{km}^{2}\right)$ |
| :--- | :--- | :--- | :--- |
| Europe |  | $9,938,000$ |  |
| Asia |  | $43,998,000$ |  |
| Africa | $29,800,000$ |  |  |
| North America |  | $24,250,000$ |  |
| South America |  | $18,840,000$ |  |
| Oceania |  | $7,690,000$ |  |

Use the factor tiles to create a model for each problem and find the simplified answer.

| 1. $\frac{x^{6}}{x^{4}}=$ | 2. $\frac{y^{5}}{y}=$ |
| :--- | :--- |
| 3. $\frac{6 y^{4}}{4 y^{2}}=$ | 4. $\frac{3 x^{5} y}{2 x^{2} y}=$ |
| 5. $\frac{x}{x^{3} y^{2}}=$ | $6 . \frac{4 x^{2} y^{3}}{10 x^{3}}=$ |

7. How would you explain a "shortcut" for dividing expressions with exponents?
8. Use your shortcut to complete the problem discussed earlier in class: What is the population density of Europe?
9. A company needs to move $1.25 \times 10^{5}$ crates of oranges. A single truck can transport $2 \times 10^{3}$ crates. Using your shortcut, how many trucks are needed to transport all of the crates?

An exponent of 0 is difficult to visualize and is unique. To explore this, use tiles to model each of the following expressions and simplify.

| $10 . \frac{x^{3}}{x^{3}}$ | 11. $\frac{2^{3}}{2^{3}}$ | 12. $\frac{y^{4}}{y^{4}}$ |
| :--- | :--- | :--- |

Now use your shortcut from \#7 to write each of the expressions as a base raised to a power.

| 13. $\frac{x^{3}}{x^{3}}$ | 14. $\frac{2^{3}}{2^{3}}$ | 15. $\frac{y^{4}}{y^{4}}$ |
| :--- | :--- | :--- |

16. What is the value of any base raised to the 0 power?

Simplify the following expressions.

| 17. $(9 x)^{0}$ | $18.9 x^{0}$ | $19 .\left(5 x^{2} y^{6}\right)^{0}$ | $20.5\left(x^{2} y^{6}\right)^{0}$ |
| :--- | :--- | :--- | :--- |

Other types of operations are used with exponents. In the following problems, a power is raised to another power. Use the factor tiles to create a model for each problem and find the simplified answer.

| 21. $\left(x^{2}\right)^{4}$ | 22. $\left(x^{4}\right)^{2}$ |
| :--- | :--- |
| 23. $\left(x y^{2}\right)^{3}$ | 24. $\left(x^{2} y w^{2}\right)^{3}$ |
| 25. $(3 x y)^{2}$ | $26.3(x y)^{2}$ |

27. How would you explain a "shortcut" for raising a power to a power?
