

Why Study Nutrition?

AG 240

Declining U.S. Farm POPULATION

In 1880, the farm population in the United States was 22 million. Today, the population stands at less than 5 million. In 1935, the number of farms in the United States peaked at 6.8 million.

Today, 27.3 percent of Americans live in rural areas. Only 1.9 percent of Americans live on farms.

**Less than 2%
of the
Population is
involved in
Agriculture**

**Genetic
changes require
different
feeding regimes**

Source: Contemporary Issues in Agriculture

**Understand
Feed
Consumption**

Feed Costs

\$\$\$\$\$\$

- ⌘ Comprise approximately 60% of annual cow costs in cow-calf operations
- ⌘ 50-75% in other species

**Should we feed cereal
grains to people instead of
animals?**

Feed Grain Usage in U.S.

⌘ Cattle consumed 19.1%

⌘ Hogs consumed 23.1 %

⌘ Poultry consumed 26.9%

Source: NCBA Cattle and Beef Handbook-1997

Justification?

- ⌘ Livestock are efficient converters of grain to protein
- ⌘ Livestock production and use of feed grains is not part of the world's hunger problem

Digestive Process

Types of diets

⌘ Herbivore

⌘ Carnivore

⌘ Omnivore

Types of Digestive Systems

⌘ Monogastric

⌘ Ruminant

Digestion Definition

- ⌘ Mechanical, chemical and enzymatic action necessary for food to be “usable” by body
- ☑ “Usable” - Converting complex nutrients into forms that can be absorbed by animal

Digestive Steps

⌘ Prehension

⌘ Mastication

⌘ Deglutition

⌘ Regurgitation (ruminants only)

Digestive Steps con't

⌘ Digestion

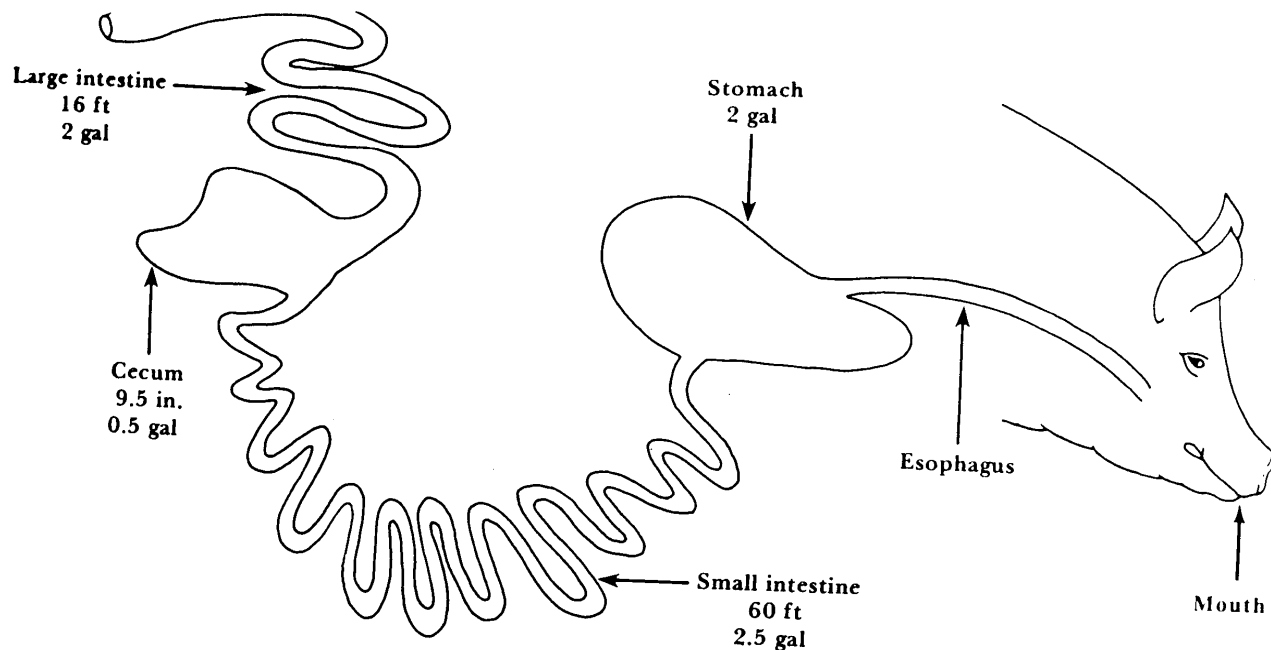

⌘ Absorption

⌘ Excretion

⌘ Peristalsis

Monogastric Digestive System

⌘ Simple stomach with one compartment

Simple digestive tract—14 × body length. Total capacity 7 gal. 44 teeth.

FIGURE 1-5. Digestive system of the pig.

Swine Structure

⌘ Mouth

⌘ Esophagus

⌘ Glandular Stomach

⌘ Small Intestine

⌘ Large Intestine

Mouth and Esophagus

- ⌘ Tongue

- ⌘ Teeth

- ⌘ Saliva (3 paired glands)

 - ☑ Water

 - ☑ Mucin

 - ☑ Bicarbonate salts

 - ☑ Amylase

- ⌘ Esophagus connects mouth to stomach

- ⌘ Sphincter Valve (cardiac)

Glandular Stomach Regions

⌘ Esophageal

⌘ Cardiac

⌘ Fundic

⌘ Pyloric

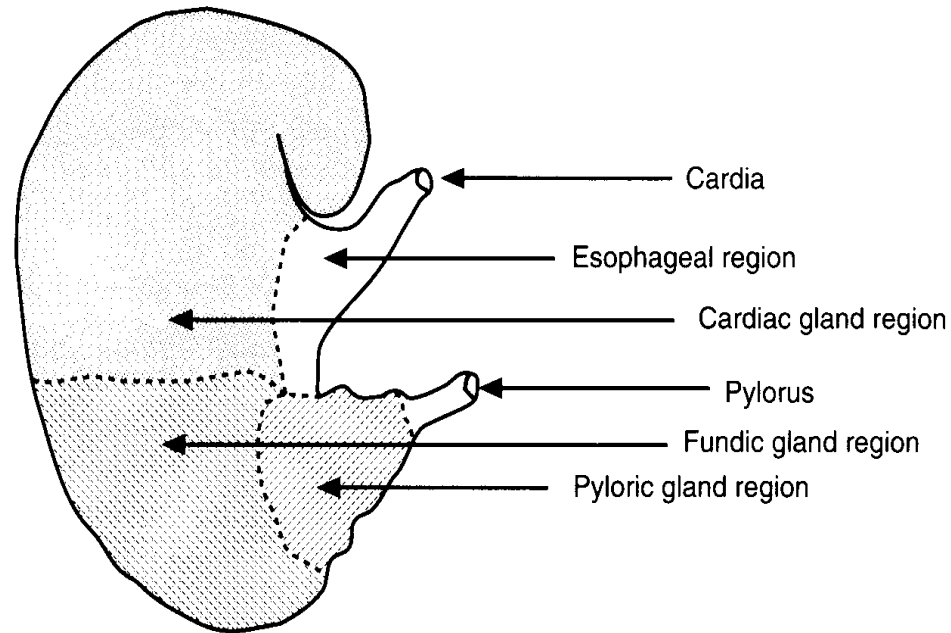

FIGURE 1-6. Swine stomach.

Chemical Digestion

⌘ HCL

⌘ Mucin

☑ Coats the lining of the stomach

⌘ Pepsinogen

☑ Converts to Pepsin when food is present

⌘ Rennin

⌘ Lipase

Swine Stomach

Source: University of Guelph, Canada

Final notes on Swine Stomach

⌘ pH of 2

- ☑ Very acidic

- ☑ Denatures proteins

⌘ Chyme

- ☑ Partially digested food leaving stomach

⌘ Pylorus Sphincter

- ☑ Separates stomach and small intestine

Swine Small Intestine

Source: University of Guelph, Canada

- ⌘ Primary site of enzymatic digestion
- ⌘ Walls lined with villi
- ⌘ pH is 6 to 7
- ⌘ Muscular contractions move food

Sections of Small Intestine

⌘ Duodenum

- ☑ Active site of Enzymatic digestion
- ☑ Bile
 - ☑ Neutralizes pH of chyme
 - ☑ Produced by liver and stored in gall bladder
 - ☑ Emulsifies fats
- ☑ Pancreatic enzymes

Sections of Small Intestine con't

⌘ Jejunum

⌘ Ileum

Primary site for nutrient absorption

Walls lined with villi

Large Intestine Functions

⌘ Absorption of water

⌘ Form solid waste

⌘ Some microbial fermentation

Large Intestine Sections

⌘ Cecum

- ☑ Microbial digestion; very little in pig

⌘ Colon

- ☑ Largest part
- ☑ Water absorption

⌘ Rectum

- ☑ Elimination of indigestible food

Swine Cecum

Source: University of Guelph, Canada

Functions of GI Tract

⌘ Digestion

⌘ Absorption

⌘ Excretion of elements

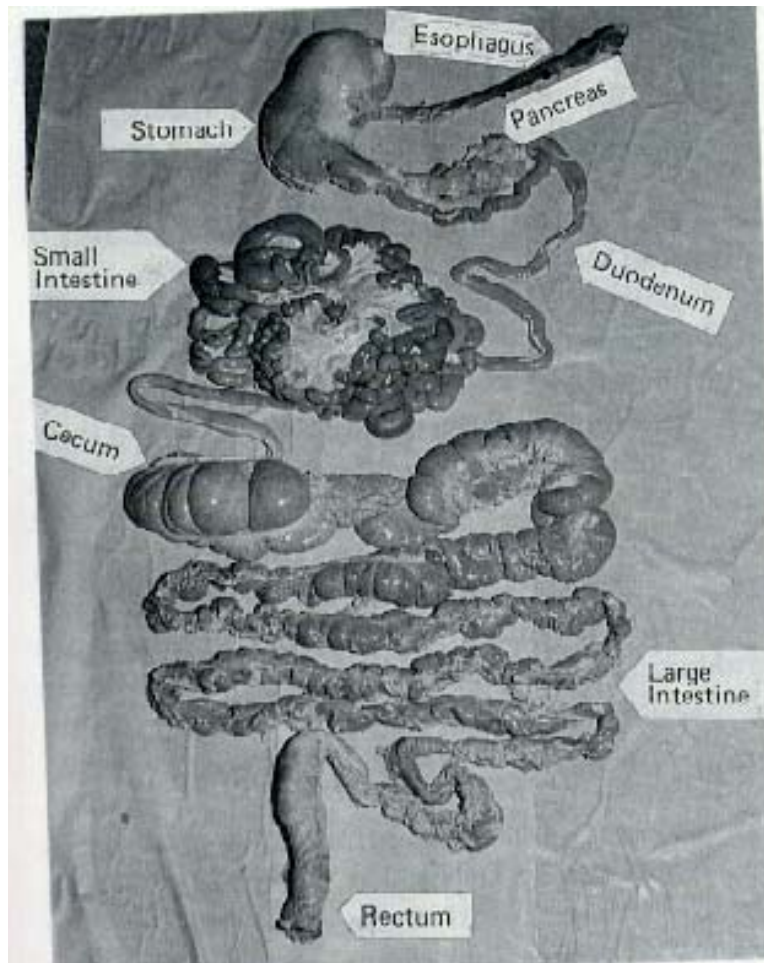

⌘ Synthesis of nutrients by micro-organisms

☒ Coprophagy

☒ Consuming own feces

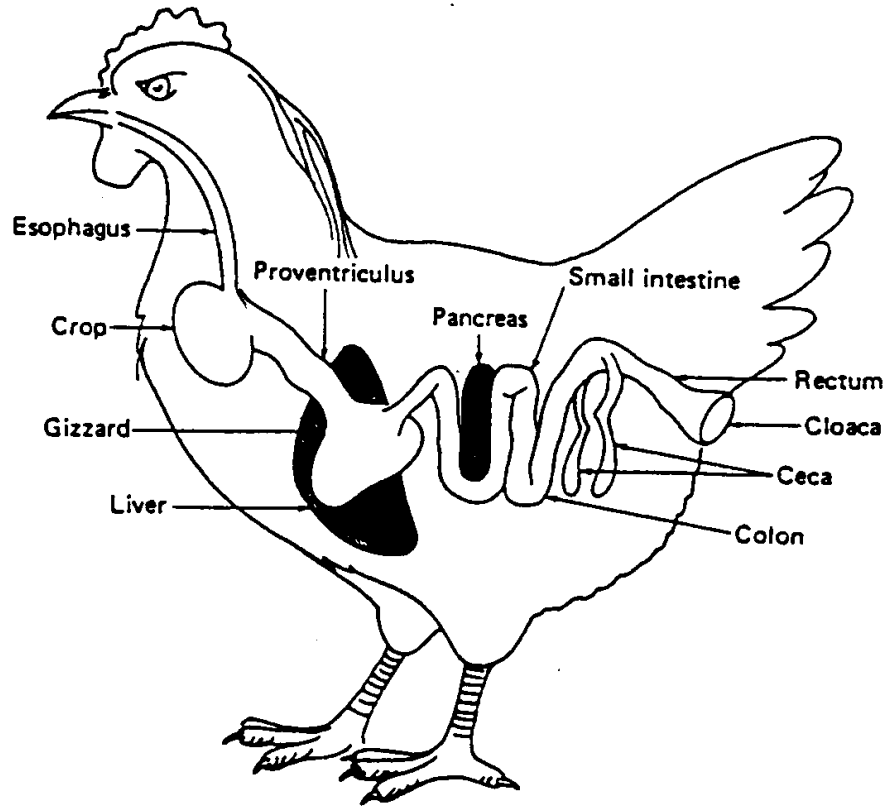

☒ Primarily in rabbits and rats

Swine Digestive System

(Kellens/Church)

Chicken Differences

⌘ Mouth

⌘ Crop

⌘ Proventriculus

⌘ Gizzard

Chicken Differences con't

⌘ Small Intestine

☑ Very long

⌘ Large Intestine

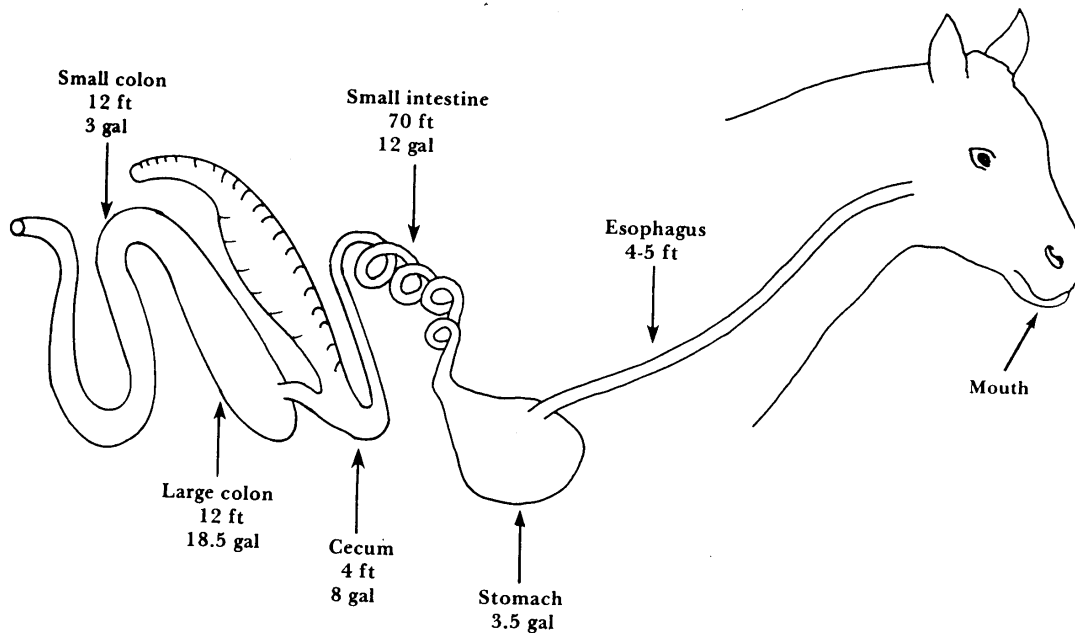

☑ 2 ceca

☑ Short LI

☑ One excretory gland

(Kellens/Church)

Horse Differences

More complex digestive tract—12 X body length. Total capacity 45 gal. 40 or 42 teeth.

FIGURE 1-7. Digestive system of the horse.

- ⌘ Mouth
- ⌘ Esophagus
- ⌘ Stomach
- ⌘ Small Intestine
- ⌘ Large Intestine
- ⌘ 60% of tract
